E/R MODEL

Relational Model in 3NF

Our current model is a completely new design in comparison to our warm-up project because we felt our original design was heavily lacking in its ability to be implemented. We took into account the comments by the TA in order to make the system adequately fit the requirements. Since then, our knowledge about database organization and design has increased significantly which has resulted in a full redesign and implementation. We disregarded our warm-up project entirely while redesigning this database schema.

Assumptions

1. All employees have a set shift from 9am to 5pm. They either work on a given day or do not.
2. All branches provide all services.
3. Overage fee is charged on a flat rate monthly basis if transaction limit is exceeded not per transaction.
4. There exists an admin account that has the power to edit/delete and access all database tables and information
5. E-transfers are made to the first available receiver account as real life e-transfers require 2FA authentication and that is outside the scope of this project.
6. Transactions are made from one account to another. In the case of billing, there is a billing account which exists solely to accumulate bill payments made by all clients. The reason for this is because in order to satisfy the requirement of having multiple bills count as one transaction, they must necessarily only have one receiving account. In real life however, billing transactions are not logged as a single transaction, rather they are separate transactions to separate accounts but may be counted as a single transaction in terms of fees.
7. Credit card limits are arbitrarily inserted as clients may have different rules applied to them based on their previous banking history and extraneous factors (eg. credit score at other banks, utility payments etc.)

User Guide

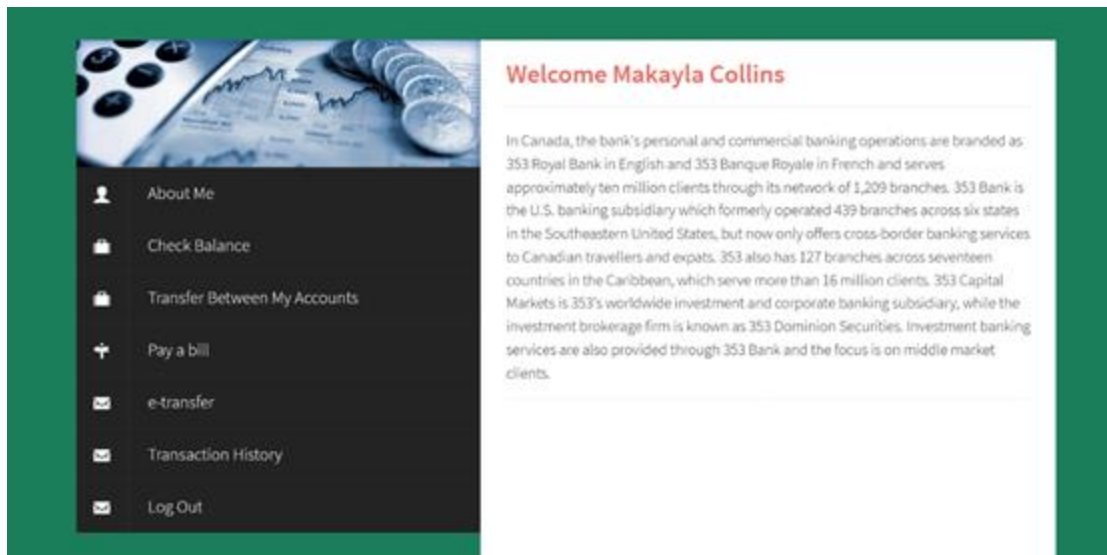

1. Sign In Page

The image shows a web form titled "CLIENT SIGN IN". At the top, there are three links: "Client", "Employee", and "Admin", with "Employee" being the active link. The form contains two input fields labeled "USERNAME" and "PASSWORD". Below these fields is a checkbox labeled "Remember Me". A teal "Sign In" button is positioned below the checkbox. At the bottom of the page, there is a copyright notice: "© All Rights Reserved."

- In this page client and Employee can sign in with their ID and password. Admin account can be signed in by Email and password.
- Simply click the button in the top can switch the sign in page to different user.

2. Client Page

Application Included:

- **About Me — Check and edit client information**

3.Employee Page

Hi

The word "Bank" is of Italian origin. Word banco (translated from Italian bench, table) in the XV-XVI centuries in the Venetian Republic was called the benches on which the money-changers and usurers were put coins and business papers. If the Jew was bankrupt and could not pay money for its payment obligations, then this bench was broken on his head.

In medieval Europe, the Roman Popes were strictly forbidden to lend money at interest to cash in on the financial difficulties of faith was considered a terrible sin. Therefore, in 1179, Pope Alexander III declared moneylenders hardened sinners and was forbidden to admit them to communion. In addition, the so-called "bankers" were not allowed to be buried on consecrated ground, so they, like suicide, was buried outside the fence of the cemetery.

Note: The UI of Signin and userpage are modified from templates of this website: <http://www.cssmoban.com/>. Others are done by ourselves by using bootstrap.

Refinement and Future Work

1. Add forgotten constraints that allow insertion and deletion.

Modify the foreign key constraints add “on delete cascade on update cascade”;

```
alter table Manager add foreign key(manager_id) references Employee(id);
alter table Employee add foreign key(branch_id) references Branch(id) on delete cascade on update cascade;
alter table Manager add foreign key(branch_id) references Branch(id) on delete cascade on update cascade;

alter table GeneralManager add foreign key(employee_id) references Employee(id) on delete cascade on update cascade;

alter table Account add foreign key(client_id) references Client(id) on delete cascade on update cascade;
alter table Account add foreign key(branch_id) references Branch(id) on delete cascade on update cascade;
alter table Account add foreign key(type_) references Type(name) on delete cascade on update cascade;
alter table Account add foreign key(option_) references ChargePlan(option_) on delete cascade on update cascade;

alter table Transaction add foreign key(sender) references Account(id) on delete cascade on update cascade;
alter table Transaction add foreign key(receiver) references Account(id) on delete cascade on update cascade;
alter table Schedule add foreign key(employee_id) references Employee(id) on delete cascade on update cascade;
```

2. Set limit for transfer money.

Before transfer money check the liability limit as well. If (balance-transfer amount)>liability limit then do the update.

```
if(!empty($_POST['from'])&&!empty($_POST['to'])&&!empty($_POST['amount'])) {
    echo $_POST['from'];
    echo $_POST['to'];
    echo $_POST['amount'];
    $records = $db->prepare('update account set balance=balance+:transfer_amount where id=:account_number1
    update account set balance=balance-:transfer_amount where id=:account_number1
    and (balance-:transfer_amount)>liability limit;');
    $records->bindParam(':transfer_amount', $_POST['amount']);
    $records->bindParam(':account_number1', $_POST['from']);
    $records->bindParam(':account_number2', $_POST['to']);
    if($records->execute()){
        $message = 'Successful Change!';
    } else {
        $message = "Sorry,Failure!";
    }
}
```

3. Update transaction history when money is moved.

```

if(!empty($_POST['from'])&&!empty($_POST['to'])&&!empty($_POST['amount'])) {
    echo $_POST['from'];
    echo $_POST['to'];
    echo $_POST['amount'];
    $records = $db->prepare('update account set balance=balance+:transfer_amount where id=:account_number1
    update account set balance=balance+:transfer_amount where id=:account_number1
    and (balance+:transfer_amount)>liability_limit;
    insert into transaction (sender,receiver,date,category,amount)
    (:account_number1,:account_number2,$data,'transfer',:transfer_amount)');
    $records->bindParam(':transfer_amount', $_POST['amount']);
    $records->bindParam(':account_number1', $_POST['from']);
    $records->bindParam(':account_number2', $_POST['to']);
    if($records->execute()){
        $message = 'Successful Change!';
    } else {
        $message = "Sorry,Failure!";
    }
}

```

4. Create basic account for client(Insert into Client table)

```

$records = $db->prepare("insert into Account values(:id, :name, :address, :dob, :join_date, :phone, :email, :password);");
$records->bindParam(':id', $_POST['id']);
$records->bindParam(':name', $_POST['name']);
$records->bindParam(':address', $_POST['address']);
$records->bindParam(':dob', $_POST['dob']);
$records->bindParam(':join_date', $_POST['join_date']);
$records->bindParam(':phone', $_POST['phone']);
$records->bindParam(':email', $_POST['email']);
$records->bindParam(':password', $_POST['password']);
if($records->execute()){
    $message = 'Successful Change!';
} else {
    $message = "Sorry,Failure!";
}

```
